COMMONWEALTH OF PENNSYLVANIA
DEPARTMENT OF MINES AND
MINERAL INDUSTRIES
HARRISBURG

H. B. CHAMBURY
THE SECRETARY

May 23, 1966

The Honorable William W. Scranton
Governor
Commonwealth of Pennsylvania
Harrisburg, Pennsylvania

Dear Governor Scranton:

In compliance with the Act of April 14, 1903,
I transmit herewith the Report of the Department of Mines
and Mineral Industries for the year ending December 31,
1965, covering in detail the operations in the Anthracite
Division of Pennsylvania.

Respectfully submitted,

H.B. Chambury
H. B. Chambury

WILLIAM W. SCRANTON
GOVERNOR OF PENNSYLVANIA

Governor Scranton is a graduate of Yale University and its Law School. He served with the Air Force in World War II as a Pilot and Operations Officer with the rank of Captain and, upon returning to civilian life, became directly involved in various businesses, including publishing, banking and broadcasting.

For years he was a leader in the effort of his home city, Scranton, Pennsylvania, to diversify its economy by the establishment of new industry there. He meanwhile served in many capacities with charitable organizations, educational institutions and hospitals.

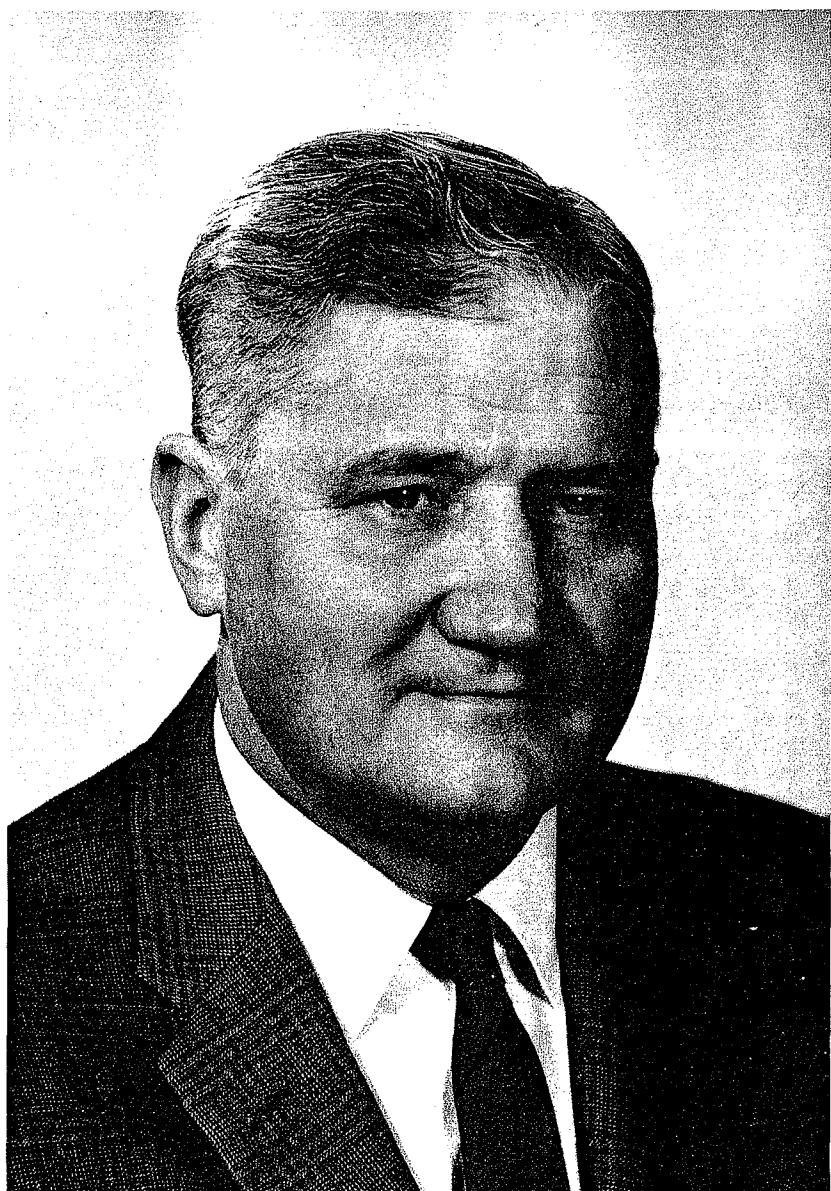

His first service in Government was as a Special Assistant to Secretary of State Christian Herter, where he administered the Secretary's private office and represented the United States at international conferences. He was elected to the 87th Congress in November of 1960 from a District which had a 34,000 Democratic registration majority.

In 1962, he was the Republican candidate for Governor of Pennsylvania and carried the State with a 486,000 vote majority.

Since becoming Governor, he has led Pennsylvania into a new era of prosperity and social progress, and heads one of the most progressive Administrations that the State has ever experienced.

Governor Scranton's awareness and understanding of coal region problems has enabled his Administration to effect changes in laws pertaining to mining which are among the most vital in the history of the coal industry. The Governor's continuing interest in coal region problems was never more evident than on the four different occasions that he appeared before Congressional Committees during 1964 and 1965 to champion a stronger, more effective Appalachian Regional Development Act. He outlined and then submitted proposals on the five problems of strip mine reclamation, mine subsidence, surface and underground mine fires, unsightly culm piles and acid mine water drainage that were all wholly incorporated into the Appalachian legislation finally adopted.

It was first determined by Governor Scranton's Administration that the ugly culm piles or mine refuse banks which dot the coal-producing areas could be used in backfilling abandoned mines to prevent surface subsidence. By using the culm piles for this purpose, three of the five main problems confronting the mine areas of the State are being positively attacked.

H. B. CHARMBURY

SECRETARY OF MINES AND MINERAL INDUSTRIES

H. Beecher Charmbury was appointed Secretary of Mines and Mineral Industries by Governor Scranton on January 30, 1963. He was born on September 21, 1914, in Hanover, Pennsylvania. In 1936, he was graduated Cum Laude from Gettysburg College with the degree Bachelor of Arts, in 1937 from the University of Pennsylvania with the degree Master of Science, and in 1942 from the Pennsylvania State University with the degree Doctor of Philosophy. He was married to Miss Mildred Louise Wentz in 1938, and they have two children; Deborah Louise and Thomas Elert.

From September, 1937 to January, 1963 Dr. Charmbury was a member of the faculty of the Pennsylvania State University, serving successively as Research Assistant, Assistant Professor, Associate Professor, and eventually Professor and Head of the Department of Mineral Preparation. He was an invited lecturer at the Third International Coal Preparation Congress at Liege, Belgium in 1958, and at the First European Symposium on Size Reduction at Frankfurt, Germany in 1962.

He has served as technical consultant to various companies, organizations and municipalities on problems related to the preparation, beneficiation and utilization of bituminous and anthracite coals and metallic and nonmetallic minerals in addition to problems related to the causes and control of air pollution. He is the author of numerous published papers.

The Secretary is a member of the American Institute of Mining, Metallurgical and Petroleum Engineers, the American Chemical Society, the American Mining Congress, the American Association of University Professors, the American Society for Engineering Education and the National Academy of Sciences. He is a member also of the Grace Lutheran Church of State College, Pennsylvania; Patmos Lodge No. 348, F. & A. M.; and B. P. O. Elks, of which he is a former State President. He is a former Chairman of the Centre County Republican Executive Committee. Dr. Charmbury is listed in American Men of Science, Who's Who in American Education, Who's Who in Engineering, Who's Who in the East, and Leaders in American Science.

ECONOMIC CHANGES BRING NEW TECHNOLOGY IN THE COAL INDUSTRY

At the beginning of the present century, coal and iron were the keys to industrial prosperity. At that time, and for a number of years afterward, Pennsylvania led all the states in mineral production. In a typical year after World War I, for example, this state's production of coal was 200,000,000 tons.

In the entire United States almost 90 percent of the energy formerly was generated by coal. Now, however, coal accounts for but 22 percent of the energy generated. This indicates the drastic reduction in the output of Pennsylvania coal. In contrast to the period after World War I, the figures for 1964 show a drop in production to 93,846,480 net tons. This drop has created a serious economic problem in a state so greatly dependent on the coal industry. With the reduction in coal production, employment has dropped considerably during those years (the number of miners alone from 280,011 to 43,149).

EXTENSIVE RESERVES IN PENNSYLVANIA

The reduction in coal output is due not to depletion of Pennsylvania's coal reserves but to shifts in demand. It is estimated that there are more than seven billion tons of anthracite and more than 28 billion tons of bituminous coal still unmined in Pennsylvania.

All shifts in demand take place through the price mechanism. For certain purposes aluminum, concrete, glass, and plastics have become acceptable substitutes for steel. The relatively high price of steel is due in part to the high price of coal. Changes in steel-making practices aimed at reducing costs are threatening the use of coal as it is now known. Stricter air pollution laws may tend to delay the establishing of many new mine mouth power plants.

The problems that the Pennsylvania coal industry is facing do not stop with unemployment, costs, and coal output. Mine subsidence, or cave-ins where voids have been left by coal mining, has caused considerable property damage. Acid mine drainage is another problem. Because of the physical characteristics of coal, when it is acted upon by bacteria and combined with water, sulfuric acid is formed; and that results in the pollution of streams. Burning refuse piles constitute an additional problem.

In spite of the present discouraging state of the coal industry, many experts believe that coal has a promising future both as a raw material and as a source of energy. The former is illustrated by the increasing demand for organic chemicals and carbon as a filtering agent. The extent to which Pennsylvania's coal industry will profit by these new prospects depends upon research and development, upon coal policies, and upon the ability of Pennsylvania operators to mine coal at a cost that will make possible effective competition with operators in other states.

Research and Development

As far back as 1939, coal operators and economists with foresight saw on the horizon obstacles that would have to be overcome and realized that improvements would have to be made. Recognizing research as a means of improving and stabilizing the industry, they urged legislative action. (The General Assembly made a small grant to the Pennsylvania State University with the provision that every State research dollar be matched with one from the industry. This initial grant laid the foundation for growth in coal research.)

(In 1955 the General Assembly, acting on recommendations of the Panel of Technical Advisors of the Joint State Government Commission, created the Coal Research Board.) In 1956 it passed Act 651, designating the Board to carry on research on the economics, the technology, and the marketing of anthracite and bituminous coal and their by-products for the purpose of developing new uses and increasing markets for such coal. The sum of \$500,000 was appropriated for use by the Board. The law requires that the Board be composed of seven members, namely: the Secretary of Mines and Mineral Industries, who is designated as Chairman; two anthracite operators; two bituminous coal operators; one representative of the labor collective bargaining agency of the anthracite industry; and one representative of the labor collective bargaining agency of the bituminous coal industry. All members except the Secretary of Mines and Mineral Industries are appointed by the Governor, each for a term of three years. (In 1963, the scope of the Coal Research Board was increased to include problems confronting the industry such as water and air pollution, mine fires, mine safety, and the development of coal mineral complexes.)

(Through July 1, 1966, a total of \$2,525,000 has been appropriated by the Legislature to the Coal Research Board.) Of that amount, the sum of \$475,000 was appropriated for the fiscal period 1963-1964, and \$500,000 each for the fiscal periods 1964-1965 and 1965-1966.

Projects conducted in past years were selected by the Board from proposals submitted by qualified research agencies. Project proposals demonstrated a need for conducting basic or fundamental research concerning the various factors related to coal; but they presented few ideas for research in applied uses for coal. The result was that the Board had little choice but to assign the bulk of its available funds to projects concerned with basic or fundamental research.

ACTIVE PROJECTS FOR COAL RESEARCH BOARD

At the present time 23 active research projects are being carried out for the Coal Research Board by three colleges, four industrial corporations and two coal industry institutions. The subject matter under study is in the fields of export market development, domestic market development, water pollution abatement, strip mine restoration, optimization of mine production, reduction of ash and sulfur content in coal, coal combustion characteristics, economics of the coal industry,

use of coal refuse products, reduction of mine disaster causes, removal of coal float dust, extinguishment of coal refuse bank fires and use of coal in removing airport fog.

There are now under way, four pilot plant projects through which technical information developed under previous laboratory projects can be applied and field tested. The first of these projects is a mobile acid mine drainage plant, designed and built in 1964, which has been used in studying mine drainage at six field locations. This plant has sufficient flexibility that new laboratory developments can be tested in the field. As economic and technical data are derived from the operations of this pilot plant, many unknowns will be resolved.

The second pilot plant is devoted to the treatment of coal refuse to separate combustible from non-combustible values. Arrangements have been made to use the non-combustible material to fill underground mine voids in the Commonwealth's program for the prevention of surface subsidence. The combustible portion will be tested in a nearby commercial power plant to ascertain its usability as power plant fuel. This pilot plant is also a direct result of theoretical and applied research sponsored by the Coal Research Board in the past.

The third pilot plant project consists in pursuing a means of disposing of acid water that is being discharged into streams. The technical and economical feasibility of permanent disposal of contaminated water by deep well injection into subterranean zones of mineralized brines is being studied. To date a deep disposal test well is being drilled by a major steel company under the direction of engineers for the Pennsylvania State University, and results are expected on this process by the Spring of 1966.

PILOT PLANTS NOW IN OPERATION

The fourth pilot plant that is being tested is one for converting mine drainage, through flash-distillation, into ultra high quality drinking or industrial water. Distillation of acid mine drainage water has many potential benefits to the localities where streams are now polluted. Data are needed, however, to establish the market value of distilled water as well as other potential by-products in these communities in order to establish the relative overall cost comparison of distillation to lime neutralization.

The Board is now carrying on six projects, either begun in 1965 or being finished from previous years, which are related to coal market development. They are as follows: (1) The economic and technological study of domestic markets for Pennsylvania anthracite; (2) The dissipation and removal of fog from airports by the application of fine anthracite; (3) Airport fog dispersal by the heat blitz method; (4) The study of high moisture pulverized coal flames; (5) The economic importance of the coal industry to Pennsylvania; and (6) An economic and technological study of European markets for Pennsylvania anthracite.

Another well received activity sponsored by the Board, by which it is hoped to increase mine safety, was that of several five day "short courses" at the Pennsylvania State University on the study of Rock

Mechanics as a basis for strata control. Mine inspectors and representatives of industry from both anthracite and bituminous coal fields attended these courses and learned of the latest technology. Greater "know-how" by these newly trained men should be reflected in improved roof control, improved safety and over-all better protection against cave-ins.

The projects being carried on by the Board to improve mine safety are: (1) an investigation of effective measures to combat mine disasters; and (2) an investigation of methods for control of float dust in coal mines.

Projects now being carried on for the purpose of reducing mining costs are in the fields of (1) strip mining and land restoration; (2) optimization of mine production systems for low cost mining.

One project is being carried on to improve the quality of coal by the reduction of ash and sulfur in bituminous coals during preparation.

Projects to treat refuse banks and refuse material are as follows: (1) The characteristics and preparation of anthracite breaker refuse and the suitability of derived products for industrial use; and (2) A pilot plant for treatment of culm bank material.

In addition to the mine drainage pilot plant previously mentioned, nine projects have been funded by the Coal Research Board in seeking solutions to the acid mine drainage problem. It is worthy to note that during the calendar years 1964 and 1965 the coal industry contributed \$111,325 to aid research seeking solutions to the acid mine drainage problem. This is the first time that industry has joined with the State Government in a mutually beneficial endeavor aimed at solving this common problem of mine drainage.

MINE DRAINAGE RESEARCH PROJECTS

Acid mine drainage research is being carried on through the following projects:

- (1) An investigation of the technical aspects in the control and disposal of mine water to minimize stream pollution.
- (2) The control of mine stream pollution by removal of the impurities from drainage streams.
- (3) A bibliography on acid mine drainage.
- (4) An investigation on the extraction of iron in acid mine drainage waters.
- (5) The elimination of pollution in mine drainage.
- (6) The design, fabrication, and operation of a mobile demonstration plant for the treatment of acid mine drainage.
- (7) A feasibility study of the application of a flash distillation process for treatment of acid mine drainage water.
- (8) Removal of acid from mine drainage by ion retardation.

- (9) The effect of acid mine drainage from strip mines on the ground reservoir under various hydrogeologic environments within the Mercer Quadrangle, Pennsylvania, and the mutation of water as it moves through the ground water reservoir.
- (10) Control of water quality in coal preparation plant effluent.
- (11) Pumping acid mine water from the West Branch of the Susquehanna River into an abandoned mine to improve alkalinity content.

Up to the present time, 53 technical reports have been prepared concerning many of the individual projects that have been conducted by the Coal Research Board. A great quantity of information not previously known has been recorded. These records have been distributed to the coal industry, agencies, libraries, and scientifically-minded individuals. It is believed that the availability and the use of this material have been of direct assistance in making possible some of the recent developments in the use of coal.

In order to plan for future research, the Board has solicited suggestions for research areas and specific problems from the coal industry and labor, and it has compiled a list of areas in which Board members think that research may prove useful. Compilation of problem areas was prepared, then distributed to research agencies of known ability, with facilities for undertaking coal research. Proposals were solicited for projects aimed at correcting or gaining information on the problem or problems presented. The Board continuously evaluates these proposals in the light of the long- and short-term needs of the coal industry, and grants contracts as funds permit.

The Pennsylvania coal industry today is faced with the task of doing in a short time research that ought to have been undertaken many years ago. It is reasonable to believe that if an adequate research effort had been made in the past many of today's problems would not exist. A coal research program, broad in scope and extending into the future, should contribute greatly toward opening the doors to vast and valuable mineral reserves remaining in Pennsylvania.

Mine Refuse Bank Fires

Under a program authorized by Act 3A of the General Assembly, approved March 3, 1964, supplemented by Act 25A, approved July 9, 1965, the Department was authorized to use money specifically for the purpose of extinguishing, curtailing, and preventing the spread of mine refuse bank fires. (These funds were not intended to be used to extinguish large bank fires because methods to do this are not known.) Of these funds, the sum of \$53,500 has been used to do experimental work on the Huber bank, particularly in Ashley Borough. The Department is endeavoring to make arrangements with the Federal Department of Health, Education and Welfare to continue this experimental project with that Department. Under the proposed ar-

rangement the Commonwealth would provide \$71,500 and the Federal Government, three times that amount.

In 1965 plans were under way for a project to extinguish fire in the abandoned Baker bank in the City of Scranton. In this project, five horizontal boreholes are to be drilled in a section of the bank beginning at its southern end. There will be one borehole for every thirty-foot section of the bank. A charge of dynamite in each hole will be exploded to blow southward the material forming that thirty-foot section. Heavy streams of water pumped from the Lackawanna River then will be pumped onto the material which had been blasted, in order to extinguish the fire. State funds in the amount of \$32,000 have been allocated for this work. If the experiment is successful, it will lead to a larger project.

Eleven much smaller bank fire projects, each costing up to approximately \$15,000, were conducted in 1965. Of five in the bituminous area, two were in Elk County, two in Allegheny County, and one in Fayette County. Of six in the anthracite area, three were in Lackawanna County and three in Luzerne County.

Abandoned Coal Mine Services

The abandoned coal mine services are basically for the purpose of correcting conditions caused by early mining operations that are detrimental to public welfare. During 1965 the authority to carry out these services was enlarged and it now reads as follows: "To seal or close or backfill abandoned deep or strip coal mines, to fill voids in abandoned coal mines, to drill bore holes, dig ditches or construct flumes which would relieve flooding or hazardous conditions caused by mine water, and to extinguish fires in abandoned coal mines and in culm banks, in those instances where such work is in the interest of the public welfare."

During the last year the Department conducted 41 projects under this program, using State funds only. Of these projects, 30 were conducted in eight counties in the bituminous coal area of the Commonwealth and 11 projects in seven counties in the anthracite area. In addition, five contract projects were conducted using equally matched State and Federal funds; these projects were limited to extinguishing mine fires. Their locations are: Blairsville Borough and Burrell Township, Indiana County; Kennedy Township, Allegheny County; Jefferson Borough, Allegheny County; Monroeville Borough, Allegheny County; Penn Hills Township, Allegheny County. The joint State-Federal project at Blairsville was a continuation of the work previously done solely at State expense.

During 1965, special emphasis was placed on sealing abandoned deep mine openings and extinguishment of fires in abandoned coal mines insofar as the services provided under this program were concerned.

Bituminous Division

In the Bituminous Division, with headquarters in Ebensburg, during 1965 accomplishments included the following: 1,637 safety inspections were made in deep mines; 1,341 U. S. Bureau of Mines safety inspection reports were submitted for review and reinspection; 88 gassy mines were inspected. (The electrical inspectors are required to accompany mine inspectors on all A.C. installations, all other electrical installations and equipment installation.) Inspectors made investigations of 95 different electrical installations of various types. Included also were 38 investigations of gas ignitions and of fires in active mines and other incidents. Six dust studies were made.

Appointed Commissions of Bituminous Mine Inspectors conducted investigations and submitted recommendations on proposed erection of public buildings, mine ventilation problems, longwall mining installations, belt installations, unsafe working conditions, alleged violations of the mining law, dust conditions and unsafe practices as reported by the U.M.W. of A. A Commission is now investigating installation of coal silos.

Inspectors investigated 29 fatal accidents, 65 nonfatal roof fall accidents, and seven natural deaths which occurred inside the mines.

The 1965 Mine Officials' Examination was passed by 270 men who now have been certified as mine officials.

The bituminous mine inspectors and electrical inspectors examinations were held in Pittsburgh, and 13 men successfully passed these examinations.

Bituminous field investigators made 1,366 waste disposal investigations and inspections.

Relative to the Mine Subsidence Insurance Fund, 578 new applications were investigated and reports processed, and 238 renewals were reviewed and reports made thereon.

Department personnel attended nine Highway Mining Commission hearings.

In the field of first aid and mine rescue, 51 classes of first aid training were held, 2,245 men were trained and certificates were issued to them; 47 classes of mine rescue training were held, 279 men were trained and certificates were issued to them; three sectional first aid meets, one state first aid meet, one state mine rescue meet, and one national first aid and mine rescue meet were held.

The mine inspectors are required to serve on committees and to attend the meets.

During the year 14 emergency trips with mine rescue trucks were made to ignitions and mine fires.

Rescue and first aid employees took 340 air samples.

Bituminous Strip Mine Reclamation

The primary accomplishment of the Department's Bituminous Bureau of Conservation and Reclamation has been obtaining and retaining the cooperation of the industry for compliance with the Bituminous Coal Open Pit Mining Conservation Act.

The reorganization of the mine inspection staff, and the assigning of separate inspectors to the inspection of bituminous strip mines, has made strip mine inspection the primary task of the men assigned to that work. Under previous procedure strip mine inspection was secondary to the inspection of deep mines.

The publishing of a Bituminous Coal Open Pit Operators Manual has been of great value to the representatives of the open pit mining industry and has eliminated much confusion in applying for the necessary open pit mining licenses and permits.

A system of having reinspection reports submitted to the Central Office has brought about uniform inspection and enforcement policies and has eliminated the previous procedure of having separate enforcement standards in individual mine inspection districts.

Strict enforcement of the provisions of the mining laws has accomplished the full intent of those laws.

Adequate training of field personnel has placed those officials in position to offer suggestions to mine operators for correcting and/or preventing violations. This policy, widely accepted by the industry, has brought about prompt correction of minor violations which could have caused major violations.

Strict enforcement of the requirements for bonding has enabled the Department to initiate a system of prompt release of bonds.

Co-operation with representatives of other States, including explanation of the requirements of Pennsylvania's law and reports of the accomplishments under that law, has tended to upgrade open pit mining legislation in other states. That has helped eliminate unfavorable competitive balances between states.

Through these accomplishments the Department has helped improve the public image of the open pit mining industry. A good start has been made toward convincing the public that mining can be accomplished, with proper conservation measures, without deterioration of land values and pollution of water.

Inspect P.M. Anthracite Division

The Anthracite Division, with headquarters in Pottsville, compiled the following record of productive effort during 1965:

There were 3,436 separate deep mine inspections, during which 101 mines or sections of mines were stopped for safety reasons; also 866 separate strip mine inspections, during which 14 operations were stopped for safety or other reasons. In addition, preparation plant inspections, culm bank recovery inspections, and electrical inspections

of deep and strip mine operations resulted in many corrective recommendations. With a total of 5,092 complete inspections during the year, by 22 inspectors, the average per inspector was almost 231.

A total of 956 inspections of waste disposal areas were conducted by inspectors. As a result of these inspections four disposal permits were revoked and two prosecutions were made.

In the field of employee safety the Department's anthracite inspectors trained 1,156 men in 107 mines in the detection of explosive gases and the care and use of the flame safety lamp; also 551 men in rudimentary First Aid, and 52 in a full scale Mine Rescue training course. In the Anthracite Division the safety record for the year shows eight fatal accidents as compared to 24 for the same period in 1964. Pertaining to the health of miners, 79 individual dust studies were made in 1965.

OUTSTANDING ACHIEVEMENTS BY INSPECTORS

There were two outstanding achievements by the inspection force: 19 separate culm bank and refuse fires discovered and extinguished under the leadership of the inspectors at no cost to the Commonwealth; 24 chapters of the Holmes Safety Council organized in areas where for years other agencies have been unsuccessful.

A rapidly expanding function of the Anthracite Division is strip mine blasting control. Department personnel regulated and monitored 8,899 blasts having a total of 20,816 blast holes. The Department actively regulates blasting in Carbondale, Plains Township, (Luzerne County), Wilkes-Barre, Plymouth, Warrior Run, Wanamie, Coaldale, Lansford, Nesquehoning, Shenandoah, Saint Clair, and Wadesville.

Under the Abandoned Mine Services Program, engineers in the Anthracite Division made studies of 25 proposed projects, initiated nine, and completed six. The engineers also serviced 27 mine subsidence insurance applications and eight safety zone applications.

The Division made 14 water supply studies to aid municipalities and industries such as the Schuylkill County Municipal Authority and the Schuylkill River Headwaters in regard to augmenting the flow for the City of Philadelphia and the City of Lebanon Water Authority.

Two major projects under study are the Kehley Run Mine Fire at Shenandoah and the Mount Carmel Mine Fire at each of which extensive exploratory drilling programs are underway.

In the field of restoration, State-owned equipment has replaced 1,417,150 cubic yards of earth in long-abandoned strip mines on public land, restoring to use 121 acres. Outstanding examples are the State Game Lands at Gold Mine in Lebanon County, a project which has additional value in improving the quality of the water to the City of Lebanon watershed, the Mahanoy City project on lands owned by the School District, and the Minersville and Kulpmont playground areas owned by the borough councils.

Forestry activity included the planting of 845,880 trees on restored strip mine lands.

The Department, using State-owned equipment, totally eliminated two culm bank fires, one at Saint Clair, the other in Schuylkill Township near the Borough of Palo Alto, each in Schuylkill County. Each of these fires would have developed into a major problem if allowed to continue.

In May, 1965, four mine inspectors were relieved of deep mine duties and assigned the sole duty of enforcing the Strip Mine Act. This change has produced the desired effect—better law enforcement because of better coverage without any increase in personnel or cost.

Anthracite Strip Mine Restoration

The Bureau of Anthracite Conservation and Reclamation, established under the terms of an Act of the General Assembly numbered 393 (P. L. 781), began functioning on November 11, 1963 when the amendment to the Anthracite Strip Mining Law became effective. Its duty is to administer all the laws of the Commonwealth governing and relating to the mining of anthracite by the open pit or strip mining method.

Regulations of strip mining require operators to be licensed, to pay license fees, and to obtain permits before engaging in the excavation of overburden or the removal of coal. In 1965, the number of licensed operators was 90 compared with 99 in 1964. The number of permits issued to licensed strip mining operators increased from 271 in 1964 to 347 in 1965. The increase in the number of permits issued, in spite of the decrease in the number of licensed operators and in the number of active open pits, was due to a requirement for the renewal of a permit at the end of every year of operation, combined with closer supervision, which confined strip mining operations to permitted areas of land.

A Land Restoration Board was created under the same 1963 legislation. Its members are: the Secretary of Mines and Mineral Industries, who is the Chairman, a registered professional engineer, a conservationist, a representative of the anthracite industry, and the Deputy Secretary of Mines and Mineral Industries for the Anthracite Region. The chief function of the Board is to review the plans of mining and restoration proposed by operators for stripping pits in excess of 100 feet in depth, which will be located more than 100 feet from a public highway and more than 250 feet from a dwelling house, public building or commercial or institutional building. For those approved, the amount of final backfill required is determined by the Board and is made a condition of the permit; the operator must backfill to the extent specified.

During 1965, 57 per cent of the permits granted were for stripping areas in the category of more than 100 feet; in 1964, 37 per cent. For original permits issued, the figures are reversed from 38 per cent in 1964 to 12 percent in 1965. This was due mainly to the fact that the shallower stripping pits, less than 100 feet in depth, involved smaller areas of land. During the two-year period the Land Restoration

Board approved only three of a total of 101 original permits for alternate plans of restoration while others required replacement of all overburden in stripping pits.

Strip mining operators are required to file bonds with the Department to cover the obligations of backfilling and leveling or grading, together with planting the land areas affected by the open pit mining. During the two years of compliance with the 1963 Act, operators filed nearly \$2,000,000 with proposals to strip mine 2,072 acres of land. One of the outstanding accomplishments of 1965, through education and enforcement, was the elimination of the practice by operators of strip mining areas of land in excess of bond. No instances of this kind occurred in 1965.

During the two-year period under the Anthracite Strip Mining and Conservation Act 133, completion reports were filed and processed showing a total of 648.74 acres of land restored to original contour or to an improved contour over that existing at the beginning of the strip mining. A large percentage of anthracite open pit work consists in extending old stripping pits to greater depths and in almost all cases the area of land restored exceeds the amount affected by the new stripping. The final phase of restorations consists in planting the land affected by strip mining. The operator may either do this work himself or pay a prescribed fee to the Department on a per acre basis in order to be relieved of this obligation. During 1965 the amount of money received from operators for planting was \$24,449 compared with \$10,951 for 1964. During 1965 also 30,000 trees were planted by operators and 93,700 by the Department, all on land stripped and backfilled under the 1963 legislation. For the acreages of land restored, more than \$650,000 of bond has been released to operators during the two years of operating under the Anthracite Strip Mining and Conservation Act.

Oil and Gas Division

Because the function of the Oil and Gas Division of the Department is limited by law to the implementation of regulatory practices, accomplishments then must be defined as activities. The statistical report which follows is an exact report for the first eleven months of 1965. For the month of December, however, statistics were estimated.

The number of drilling permits issued in coal areas was 377; in non-coal areas, 26; total, 403. Drilling permits issued in coal areas pertinent to the Oil and Gas Conservation Act, 20; in non-coal areas pertinent to the Oil and Gas Conservation Act, 26; total, 46. Wells reported drilled in non-coal areas, 653; total wells reported drilled for the year, 968. Wells reported plugged and abandoned, 267. Pillar Permits issued, 145.

The total number of wells reported drilled is approximately 11 percent less than was reported for the year 1964. The year 1965 was the second most active since the organization of the Division. During 1965 activities were reported in 32 counties. There has been activity in 44 of Pennsylvania's 67 counties since the effective date of the Act,

February 1, 1956. As to underground gas storage wells, Pennsylvania continues to lead the nation in underground gas storage capacity which is 660 billion cubic feet. Of the 73 storage reservoirs in Pennsylvania, 60 are active, four abandoned, five are being depleted, and four are in the planning stage. There are sixteen of the storage reservoirs within 10,000 linear feet of operating coal mines. This means that these 16 reservoirs are under complete jurisdiction of the Division. Gas is being stored in 113 individual pools. By way of explaining this figure, some of the storage reservoirs are storing gas in more than one geological horizon.

Inspector activities were as follows:

1. During 1965 the number of inspections made was 3,597. These included investigations of drilling, casing, and plugging operations as well as periodical inspections of storage areas.
2. The Inspectors held 338 consultations during the year. These consultations were between the Department's Inspectors and management representatives of the oil and/or gas companies.
3. There were made 207 special investigations including plugging operations for the following: Kinzua Dam, Moraine State Park, Keystone Power Associates, and various State Highway construction projects. These investigations were concerned not merely with inspection trips, but rather with preparation of plugging and/or casing specifications to an alternate method as permitted by the Act.
4. There were made 67 individual complaints pertaining primarily to alleged water contamination. Most of these complaints were amicably settled even though in most instances the Department had no jurisdiction. Also investigated and reported in this category were all accidents of which officials of the Department had knowledge. Recommendations were made orally to the affected operators; and it is believed that, even without legislation, some progress relevant to safer operations was made.
5. There were 15 informal conferences held by individual inspectors. These conferences were held by the District Inspector in an attempt to settle disputes without aggravation. Since only three of these informal conferences were carried on to formal conferences in the Pittsburgh Office, it is believed that here, too, some progress has been made.

In July, 1965 the seventh Inspector for the Division was appointed. The Department is continuing to furnish the Geological Survey with all well information. Since the passage of the Oil and Gas Conservation Act in 1961, the Geological Survey has not received information directly from the operators, except that which may be forwarded willingly.

The Geological Survey, in the compilation of its reports, is dependent upon the Department for statistical information.

The first well intended primarily as a test well for the storage of acid mine drainage was drilled by the Bethlehem Mines Corporation.

If this project is successful an entirely new area of drilling will be promoted in the bituminous coal areas of Pennsylvania. One well in Beaver County and two in Erie County are being used satisfactorily for the storage of industrial wastes. Because the Act provides for the underground storage of liquids, as well as gas, this activity comes within the jurisdiction of the Department.

Activity was quiet in so far as spacing and integration orders were concerned during the year. The members of the Commission believe that the Act has served its intended purpose, in that the drilling of wells coming within the purview of the Act, has been carried on in more orderly fashion and a wider acreage arrangement.

Coal Mine Subsidence Fund

The major accomplishments of the Anthracite and Bituminous Coal Mine Subsidence Fund were effected because of Act 177, signed by Governor Scranton August 10, 1965. Under that Act the Board empowered the Fund to reduce the premiums on subsidence insurance an average of 20 percent in response to popular demand. That legislation also permitted the Fund to extend the policy period to two or three years. For the period August 10 to December 31, 1965, a total of 101 policies have been sold on this extended basis, 24 for a two-year period and 77 for a three-year period.

In addition, Act 177 permits interest on investments to be applied to administrative expenses. Because of this latter provision, the Fund showed an excess of premiums plus interest over administrative expenses in the amount of \$28,720.93 for the twelve months ended December 31, 1965. The administrative expenses for the period January 1, 1965 to December 31, 1965, were \$107,776.95, or \$12,463.23 less than for the entire calendar year of 1964.

The number of policies written for the twelve months ended December 31 was 592, compared with 755 for a similar period of 1964. This decrease is the result of applicants' waiting from March, 1965 to August 10, 1965 when the Board's anticipated authorization of rate reductions became effective. More than 2,149 policies have been written since the inception of the Fund. The present renewal rate is 85 percent. Payments per claim have been reduced from a total of \$55,268.66 (\$5,526.86 average claim) for 10 claims paid in 1964 to \$57,327.79 (\$2,729.89 average claim) for 21 claims paid in 1965.

The most significant accomplishment is the fact that the Fund met that provision of the Act which requires administrative expenses to be paid from premiums collected and interest on securities.

Appalachia Program

The Mining Area Restoration Sector of the Appalachia Program derives from Section 205 of the Appalachian Regional Development Act of 1965.

The Department prepared a total of 22 project requests and forwarded them to the Secretary of Commerce, Pennsylvania's member of the Appalachian Regional Commission, for presentation to that Commission. The Department has received no direct notification of approval of any projects. It has been unofficially advised that fifteen projects have been approved and that on two projects action has been deferred.

The Appalachian Regional Commission, like the states, has had to evolve forms and procedures in accordance with the act for handling project requests. In the field of Mining Area Restoration projects, Pennsylvania was the pioneer.

The Appalachian Regional Commission, from the start, has stressed data on social and economic justification of projects; and the broad aspects of social and economic justifications have been covered by information furnished by the State Planning Board. Local aspects and descriptive information relating to individual projects has been prepared by the Department.

Since the Department's latest transmittal to the Secretary of Commerce it has received three additional bituminous mine fire project requests. At the close of 1965 an additional anthracite mine fire project request was being investigated.

From the Scranton and Wilkes-Barre areas the Department has received strip mine reclamation requests which will require use of the revolving fund of Act 117. In process also are two bituminous strip mine reclamation project requests for State Game Lands. These will be ready for transmittal to the Secretary of Commerce early in 1966.

Data are being assembled for transmittal to the U. S. Bureau of Mines as directed by Subsection 205 (c) of the Appalachia Act which calls for a report on acreage affected by all surface or strip and surface mining. It is not limited to coal.

The Department has a contract with an engineering firm for mapping and design of strip mine reclamation projects. At the beginning, a considerable amount of joint investigation by Department engineers and Forests and Waters and Game Commission personnel was required to establish and confirm state ownership of surface and mineral in order that money would not be spent for mapping areas that the Commonwealth has no authority to restore.

Before

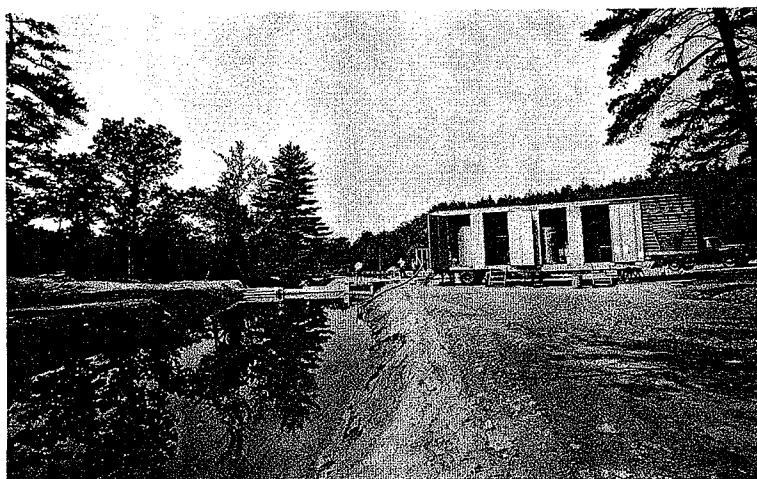

Anthracite strip mine operation in Nesquehoning Borough, Carbon County, when active.

After

The same area in Nesquehoning Borough after the strip mine operation was finished and the land restored.

"Operation Yellowboy", mobile mine drainage treatment pilot plant, in operation as a project for the Coal Research Board.

Members of the Coal Research Board examining a unit of a pilot plant for the treatment of mine drainage by flash distillation at Lester, Pennsylvania. An official of the Westinghouse Electric Corporation, at right, is explaining the device to Board Members Robert W. Rissinger, H. B. Charmbury (Chairman), Charles G. Zink and John Seddon, and partly concealed by Mr. Zink, Board Secretary David R. Maneval.

Before

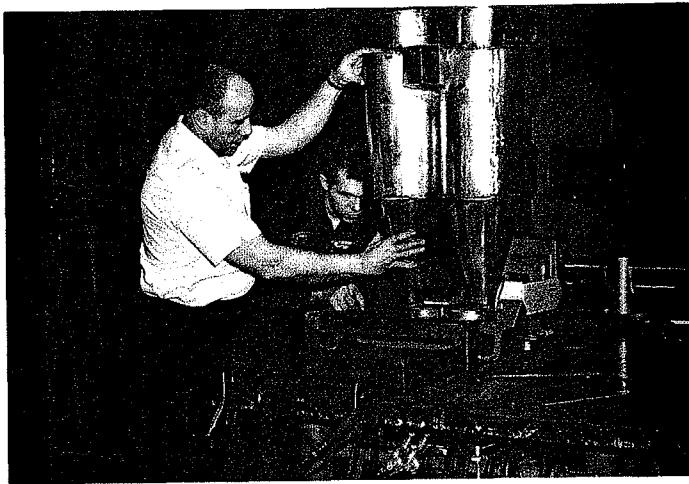

Two active anthracite strip mine operations in Foster Township, Schuylkill County, shown while the strip mining was in progress.

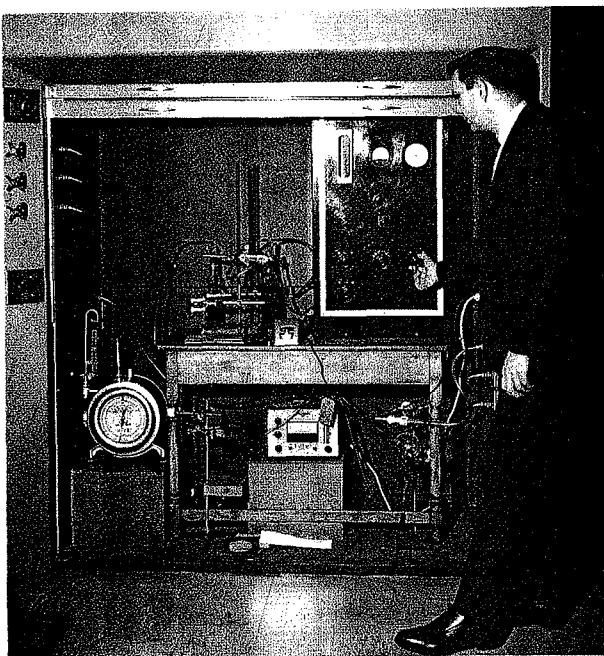

After

The same area after one operation had been completed and the land restored (in foreground). The operation in the background still active.

Project Engineer and Technician assembling field unit of float dust collection device being developed by Bituminous Coal Research, Inc., under sponsorship of the Coal Research Board. The unit is being developed for application at underground belt-transfer points and on mining machines operating at the working face.

System employed on Studies on Oxidation of Iron in Mine Drainage at Wilkes College. The system is being checked by Dr. Ralph Rozelle, head of the Department of Chemistry at the college. The project is sponsored by the Coal Research Board.

This specially designed emergency cage truck, the only equipment of its kind in the world, was used successfully by the Department in the rescue operation at Sheppton, near Hazleton, in August, 1963 and in other departmental undertakings. Suggestions and ideas of State Mine Inspectors, which were coordinated with those of design engineers, were the result of specific emergencies encountered in recovery work at shaft mines.

* Included in total production.
No accurate record previous to 1870.
\$ No accurate record previous to 1894.
% No accurate record previous to 1932.
** In 1955 and subsequent years the production, employees, fatalities, etc., of deep mines employing fewer than five (5) persons inside are included in this report.

THIRTY-SEVEN YEAR STUDY OF ANTHRACITE, BY COUNTIES

NOTE: The year 1924 was selected as a normal year, in order that comparison might be made with the depression years that are a part of this report.

In 1955, and subsequent years, the production, employees, fatalities, etc., of deep mines employing fewer than five (5) persons inside are included in the County totals.

deep mines employing some 10,000 persons. County totals.

NOTE: # Due to some companies operating in more than one district, the actual total number of Anthracite Operators is 772.

Due to some companies operating in more than one district, the actual total number of Anthracite Strip Operators is 88.

* 443 Small Deep Mines are included in the total number of Deep Mines; 1,337 Small Deep Employees are included in Deep Employees; 692,527 Small Deep Production is included in Deep Mined Production.

• Includes fatalities which occurred in Deep Mines Employing Fewer Than Five (5) Persons.

Production, How Shipped, Average Days Worked, Employees, Explosives
Fatal and Non-fatal Accidents

By Inspection District - 1965

For Mines Employing More Than Five Persons

NOTE: * No production - installing timber from slope portal through surface wash.

REPORT OF OIL AND GAS DIVISION

OIL AND GAS CONSERVATION COMMISSION
DEPARTMENT OF MINES AND MINERAL INDUSTRIES

WILDCAT WELLS - REPORTED PRODUCTIVE

- WES 421 In March, 1965, The Peoples Natural Gas Company completed the J. S. Blair Well No. 4, discovery of the Tunnel Pool, about two miles northeast of the Blair Pool, Seven Springs Field. The well had no production until Chert-Oriskany, 8,197 to total depth was fractured when the well blew in with an open flow of 11,000,000 cubic feet per day, with a rock pressure of 2722 psi in 24 hours. Total depth was 8,440 feet. The well prompted the drilling of one well a mile to the northeast, which was dry. Another well, a mile and a quarter to the southwest was about to be completed at the end of the year.
- JEF 371 Consolidated Gas Supply Corporation completed the Rochester and Pittsburgh Coal Company Well No. 2 in June of 1965, the well finding gas in the Chert-Oriskany sections at 7,095 to 7,198 feet. Initial daily open flow was 2,214,000 cubic feet, rock pressure 3845 in 31 hours. The well was not fractured. The well is two miles north of Punxsutawney. This discovery established production in the Elk Run Pool. By the end of the year four successful wells were reported drilled in the pool.
- WES 438 The Duquesne Pool was discovered in August, 1965, by completion Duquesne Gas Company No. 1 Well, of Fox, Goen and Sloan for initial daily open flow of 20,000 cubic feet, increasing to 1,200,000 cubic feet after fracture of Chert-Oriskany at 7,485, to 7,750 feet. Total depth was 7,800 feet. This well is about three and one half miles south of the discovery well of the Murrysville Pool drilled by the same operators in 1963.
- CBA 5 George L. Reade No. 1 Well was completed in October, 1965, by The Peoples Natural Gas Company for an initial daily open flow of 8,245,000 cubic feet, natural, after the well was drilled 14 feet into the Oriskany. The well was not fractured. Rock pressure was reported to be 3,193 psi after 168 hours. Total depth was 7,810. This well established the Rager Mountain Pool, about three miles north of Johnstown, with the first production from Onondaga-Oriskany horizons in Cambria County. At the end of the year unofficial reports indicated that the Maud Emma Bole No. 1 Well of T. W. Phillips Gas and Oil Company had been completed about two thirds of a mile southwest of the discovery for an initial daily open flow of about 15,000,000 cubic feet
